

INSTRUCTIONAL DESIGN PLAN: DATA COMPLIANCE MATRIX

PROJECT OVERVIEW

Target Audience: Cross-Functional Management Teams

Authoring Tools: Articulate Rise 360

Framework: ADDIE / Backward Design

1. BUSINESS PROBLEM & PERFORMANCE GAP An internal operations audit revealed an increase in data governance liabilities due to managers mishandling cross-functional feedback and failing to execute compliance protocols correctly. The root cause was identified as text-heavy, static standard operating procedures (SOPs) that did not prepare managers for real-time decision-making.

2. MEASURABLE TRAINING OBJECTIVES By the end of this asynchronous simulation, 95% of management teams will be able to:

- * Identify and isolate a data governance policy infraction within a real-world scenario.
- * Execute the correct corporate feedback response loop within 3 business minutes.
- * Mitigate compliance liabilities without relying on manual supervisor interventions.

3. INSTRUCTIONAL STRATEGY & PEDAGOGICAL APPROACH To maximize engagement and retention, this course utilizes a choice-driven Branching Scenario Matrix. Instead of passively reading data rules, learners are dropped into high-friction corporate conversations. Every decision they make triggers an immediate consequence, creating a safe environment to practice risk mitigation and learn from processing errors dynamically.
